

AI Assisted Coding

Lab Assignment- 17.1

Name: M.Abhiram

Roll.No : 2303A53026

Batch-46

Task 1: Customer Data Cleaning

Prompt

Clean customer dataset using Pandas by handling missing values, duplicates, and encoding.

Code

```
import pandas as pd

df = pd.DataFrame({
    'age': [20, None, 25],
    'income': [50000, 60000, None],
    'city': ['Chennai', 'DELHI', 'Mumbai'],
    'gender': ['Male', 'Female', 'Male']
})

df.fillna(df.mean(numeric_only=True), inplace=True)
df.drop_duplicates(inplace=True)

df['city'] = df['city'].str.lower()

df['gender'] = df['gender'].map({'Male':0, 'Female':1}) df['city']
= df['city'].astype('category').cat.codes

print(df)
```

Output

```
   age  income  city  gender
0  20.0  50000.0    0      0
1  22.5  60000.0    1      1
2  25.0  55000.0    2      0
```

Task 2: Sales Preprocessing

Prompt

Preprocess sales data by converting dates, creating features, and normalizing values.

Code

```
import pandas as pd

df = pd.DataFrame({
    'date': ['2024-01-01', '2024-02-01'],
    'sales': [1000, 2000]
})

df['date'] = pd.to_datetime(df['date'])
df['month'] = df['date'].dt.month
df['year'] = df['date'].dt.year

df['sales'] = (df['sales'] - df['sales'].min()) / (df['sales'].max() - df['sales'].min())

print(df)
```

Output

```
   date sales  month  year
0 2024-01-01   0.0    1  2024
1 2024-02-01   1.0    2  2024
```

Task 3: Healthcare Data

Prompt

Clean and preprocess healthcare dataset with scaling and train-test split.

Code

```
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import train_test_split
import pandas as pd

df = pd.DataFrame({
    'bp': [120, None, 140],
```

```

        'chol': [200, 220, None],
        'gender': ['M','F','M']
    })

df.fillna(df.mean(numeric_only=True), inplace=True)
df['gender'] = df['gender'].map({'M':0,'F':1})

scaler = StandardScaler()
df[['bp','chol']] = scaler.fit_transform(df[['bp','chol']])

train, test = train_test_split(df, test_size=0.2)

print(train)

```

Task 4: Employee Salary

Prompt

Preprocess employee salary dataset by removing outliers and encoding categories.

Code

```

import pandas as pd

df = pd.DataFrame({
    'salary':[30000,40000,1000000],
    'department':['HR','IT','IT'],
    'locat on':['Hyd','Chennai','Delhi']
})

df['department'] = df['department'].str.lower()

df = df[df['salary'] < 500000]

df['department'] = df['department'].astype('category').cat.codes
df['locat on'] = df['locat on'].astype('category').cat.codes

print(df)

```

Output

	salary	department	locat on
0	30000	0	1
1	40000	1	0
